AU BALES OFFERED		34,241	* 16.5 is the lowest Micron Price Guide (MPG) published by The Australian Wool Exchange (AWEX). Therefore MPG's below 16.5 micron are an estimate based on the best available information at the time of publication. Likewise, for any category where there is insufficient quantity offered to enable AWEX to quote, a quote will also be provided.																	
AU BALES SOLD		31,438	* Recording of 15 & 15.5 micron commenced in October 2017, and as a result some historic data is not yet available for those MPG's. Where historic data is not available an estimate based on '16 micron statistics' and incorporating the existing 15 & 15.5 micron data, will be provided as a guide.

MARKET COMMENTARY Source: AWEX

Despite the national quantity being relatively low, with 34,231 bales offered, the market opened the 2024/25 wool selling season softly, recording an overall loss for the third successive series.

The bulk of the losses were felt on the first day of selling, particularly in the fleece. This was reflected in the individual MPGs losing 3-38 cents across the country. The skirting, carding, and crossbred sectors also recorded losses. As a result, the EMI shed 13 cents on day one.

The second selling day saw the market settle to a degree, with most single-digit movements recorded, the exception being 18 microns and finer in the North, where the larger losses were recorded. Worth noting, the West (selling last) recorded small gains across all MPGs 18.5 microns and broader.

The EMI dropped another 4 cents for the day, to close the series at 1,125 (-17 cents). Despite the losses, clearance rates remain relatively high at 91.8%.

Next week the national offering is expected to fall. There are currently 32,398 bales on offer. Fremantle will now be a one-day sale (selling on Tuesday), due to limited quantity.

Definitions:

* A Percentile, is a value on a scale of one hundred that indicates the percent of a distribution that is equal to or below it. In general a percentile between 25% and 75% is considered normal, a percentile below 25% is considered below normal and a percentile above 75% is considered above normal.

Three and ten year percentiles shown on the bottom line of table 2 & 3 (above) and in table 1 (on page 1), detail the amount of time during the past 3 & 10 years where the market has traded either at or below its current price.

* Deciles are a method of sorting ranked data into 10 equal groups. The data may be ranked from largest to smallest or vice versa.

The above Decile tables sort price Percentiles into 10 equal groups (in ascending order), with table 2 ranking the previous 3 years prices, while table 3 ranks prices over the previous 10 years

Example: In Table 2, a Decile Rank of 6 for 19 microns, shows 19 microns have traded at or below 1656 for 60% of the time, over the past three years.

In Table 3, a Decile Rank of 6 for 19 microns, shows 19 microns have traded at or below 1471 for 60% of the time, over the past ten years.

The top chart displays the difference between market high and low prices for Australia. The left y-axis is labeled 'Mkt High - Mkt Low' in red. The right y-axis is labeled '1294' in blue. The legend includes: 21 AUD (black line), 21 USD (grey line), 3 Yr Ave (AUD) (blue line), 5 Yr Ave (AUD) (green line), and 10 Yr Ave (AUD) (yellow line). The bottom chart displays the 21-month moving average of 21 Mic Prod (Mkg GSY). The left y-axis is labeled '140' in blue. The right y-axis is labeled '21 Mic Prod: Mkg (GSY)' in blue. The legend includes: 21 Mic (black line). Both charts have a common x-axis representing years from 1970 to 2020.

The figure consists of two panels sharing a common x-axis representing time in years from 2000 to 2010.

Top Panel: Shows the 32-day averaged flux density in Jy. The y-axis ranges from 20 to 1000 Jy. The plot includes five data series:

- 32 AUD (black line): The highest flux density, showing significant variability and peaks around 2002, 2005, and 2008.
- 32 USD (grey line): The second highest flux density, following a similar trend to 32 AUD but at lower values.
- 3 Yr Ave (AUD) (blue line): A smoothed version of the 32 AUD data.
- 5 Yr Ave (AUD) (green line): A further smoothed version of the 32 AUD data.
- 10 Yr Ave (AUD) (yellow line): A horizontal line at approximately 400 Jy, representing the long-term average.

Bottom Panel: Shows the number of sources detected above a certain flux density threshold. The y-axis ranges from 0 to 20. The plot includes two data series:

- >30.6 Mic (black line): The number of sources detected above 30.6 mJy. The values fluctuate between approximately 6 and 12.
- >30.5 Mic Prod. M/kg (grey line): The number of sources detected above 30.5 mJy, which is not clearly visible as it follows a similar trend to the black line.
